Domestic Dwelling Fire

Methodology	2
Data Summary	5
Appendix 1	9

Methodology

The National Fire Chiefs Council, in partnership with Operational Research in Health, has proposed an initial risk assessment framework for fires occurring in residential buildings. This initiative is a segment of a broader scheme to identify and govern communal hazards. The overall objective as defined by NFCC is "to deliver an evidence-based and consistent methodology for determining 'level of risk' that also provides a national benchmarking capability". A national definition of risk has been produced which describes risk as "A combination of the **likelihood** and **consequences** of hazardous events."

Some of the key factors linked to **likelihood** of dwelling fires include car or home ownership, (un)employment, deprivation, property type and tenure:

 Health	 Transport	 Employment	 Housing	 Other Factors
<ul style="list-style-type: none">Index of Multiple Deprivation (IMD) Health and Disability Deprivation RankingProportion of people in poor or very poor health	<ul style="list-style-type: none">Car/van ownershipPrivate transport to workWalk/cycle to work	<ul style="list-style-type: none">Number of employed adults% employed in food/serviceIndex of Multiple Deprivation (IMD) Income RankingIndex of Multiple Deprivation (IMD) Employment Ranking	<ul style="list-style-type: none">Empty housingPrivate/ social rentingHome ownershipFewer rooms than required	<ul style="list-style-type: none">Index of Multiple Deprivation (IMD) Crime RankingIndex of Multiple Deprivation (IMD) Living EnvironmentMain language spokenChildren in household

Factors Influencing Likelihood

Similar factors are associated with **consequence**; however, these differ for life and property consequences, and neither provide the robust predictions as for likelihood. Individually, the correlated factors that have been identified do not necessarily contribute to higher risk, however, when considered collectively, these factors can be used to identify areas that are statistically more likely to contain people who are higher risk.

An overall consequence score can be calculated by determining a consequence score for life, based on the consequence criteria in the table below. These scores can then be plotted onto a matrix to determine an overall consequence score.

Methodology continued

LIFE		
Consequence	Definition	IRS descriptions
HIGH	Dwelling fires that resulted in a fatality or significant/life changing injuries that resulted in an individual requiring medical attention or hospitalisation.	Victim Type: <ul style="list-style-type: none"> • Fatality • Hospitalised or required medical attention
MEDIUM	Dwelling fires that resulted in an individual requiring medical attention.	Victim Type <ul style="list-style-type: none"> • Injury required minor medical attention on site
LOW	Dwelling fires where there were no reported injuries that required medical attention.	Victim Type <ul style="list-style-type: none"> • No fatalities or injuries

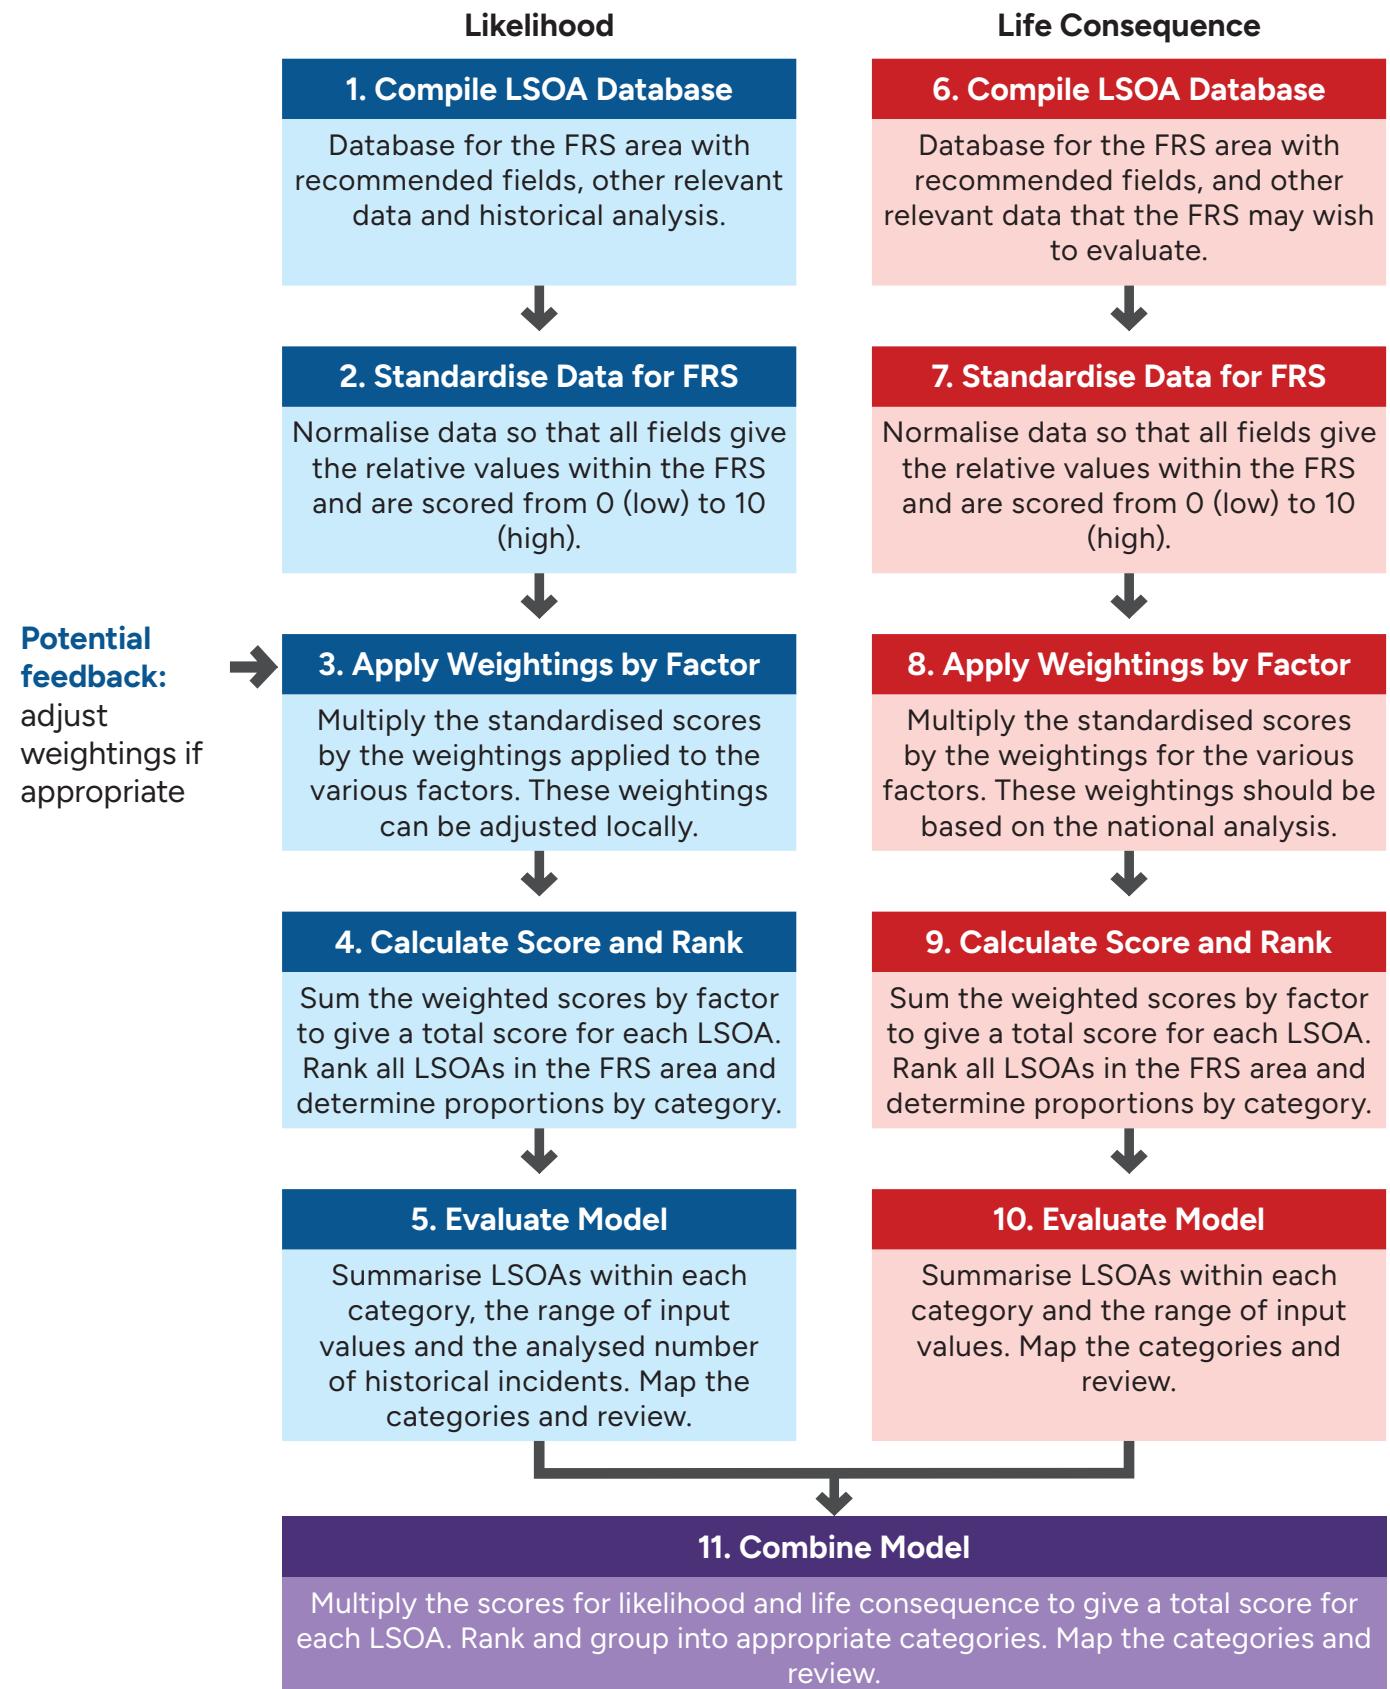

The Service has adopted the [NFCC's National Risk Methodology for UK FRS: Domestic Dwelling Fires \(2023\)](#), and chosen the Lower Super Output Area (LSOA) model for risk assessment. LSOAs are a geographic hierarchy designed to improve the reporting of small area statistics in England; there are 32,844 across the country, with an average population of 1,700 in each LSOA. There are 492 LSOAs in Herefordshire and Worcestershire. This approach leverages multiple datasets from the Office for National Statistics (ONS) to pinpoint factors that significantly correlate with a higher fire risk.

The step-by-step process brings together national modelling on the likelihood and life consequence of dwelling fires to develop a ranking of all LSOAs in an FRS, which can then form a local categorisation of risk. This is underpinned by place data at LSOA level.

The final risk score combines the likelihood of a fire occurrence with its potential life consequences, resulting in one of five risk levels calculated for each LSOA (High, Medium-high, Medium, Medium-low and Low). The analysis used five years of incident data (1 Apr 2019 to 31 Mar 2024) and was based on the latest boundaries from the 2021 Census and can be found in appendix 1.

Methodology continued

LSOA Model

Data Summary

Data summary

Figure 1 provides a visual representation of varying risk levels across specific LSOAs, pinpointing those with an increased vulnerability. The most critical areas, designated as Risk Category 5 - High, are depicted in black, indicating a significant threat level, whereas the low-risk zones, classified as Risk Category 1 - Low, are represented in a light blue.

Analytical projections have identified 26 LSOAs within the Service's jurisdiction as high-risk zones, with an additional 49 LSOAs categorised as medium-high risk. Collectively, these sectors constitute 15% of the Service's operational area.

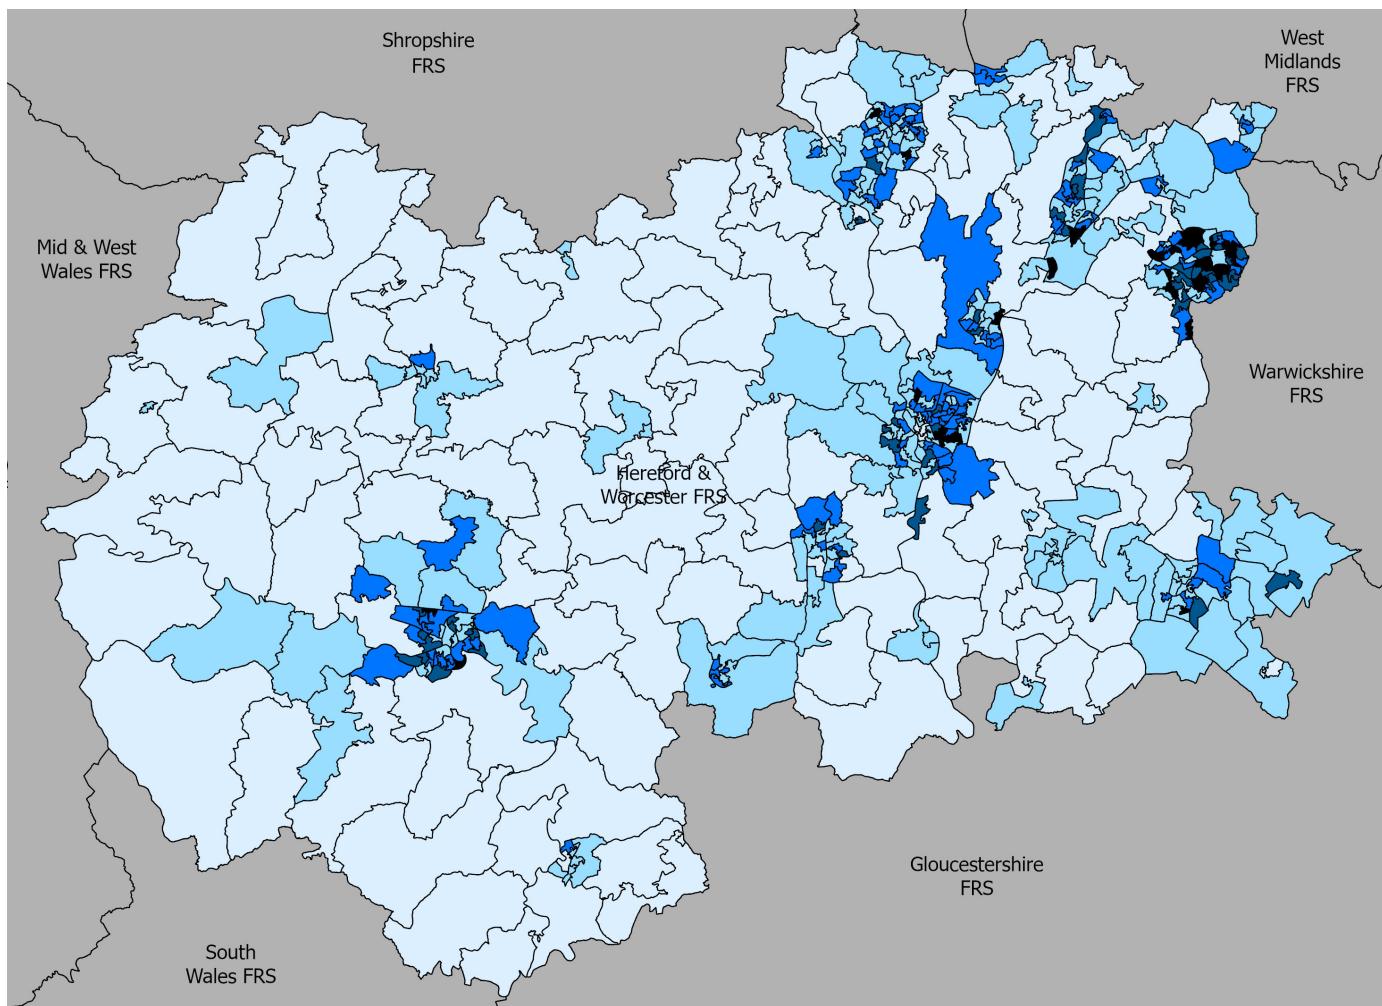

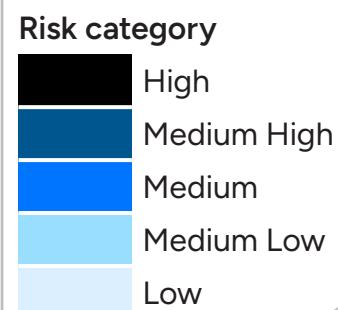

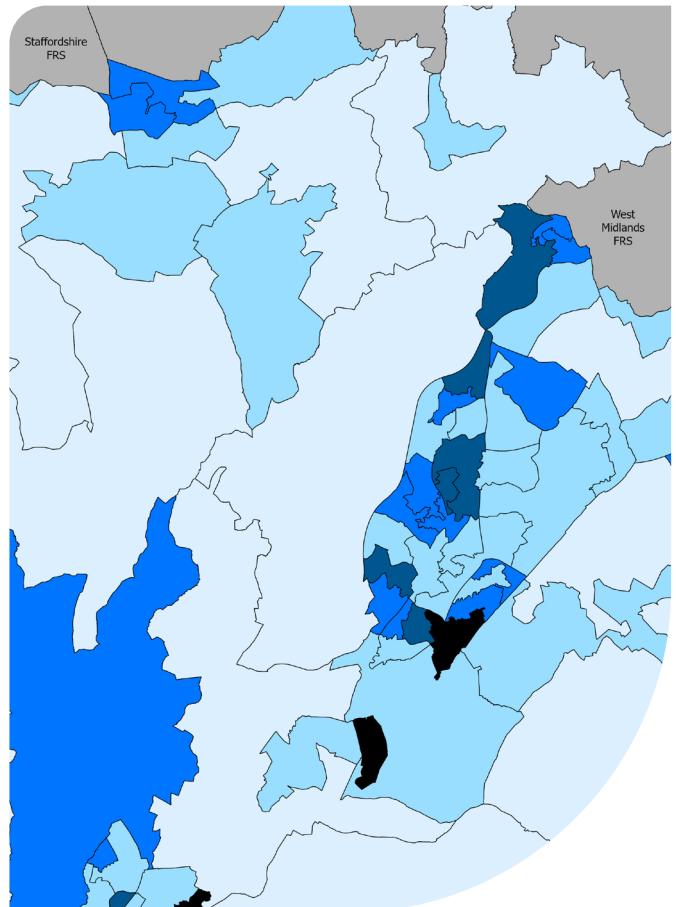

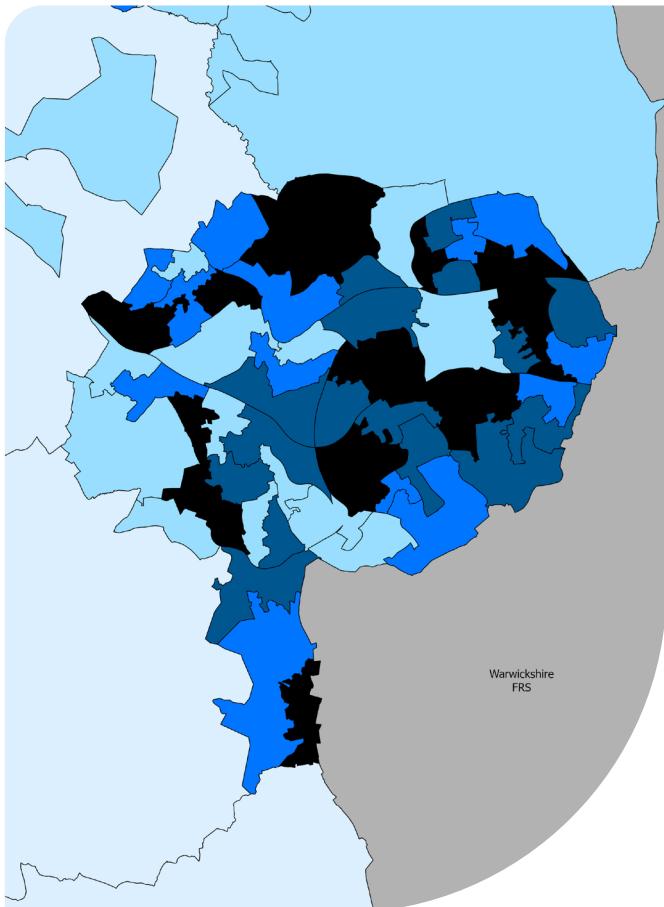

Figure 1: Dwelling Fire Risk April 2019 - March 2024

Data Summary continued

Areas of high risk of domestic dwelling fire are predominantly situated in densely populated urban areas, including:

- The Redditch Borough Council regions of Enfield, Batchley, Ipsley, Winyates West, Lakeside, Astwood Bank, and Callow Hill:
- The Bromsgrove District Council's Aston Fields:

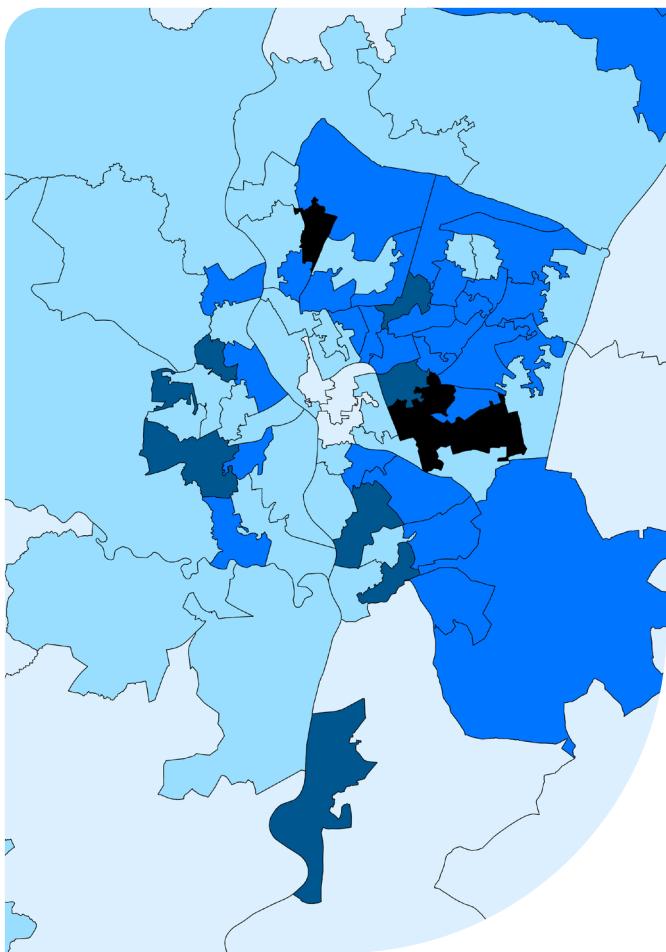

Risk category

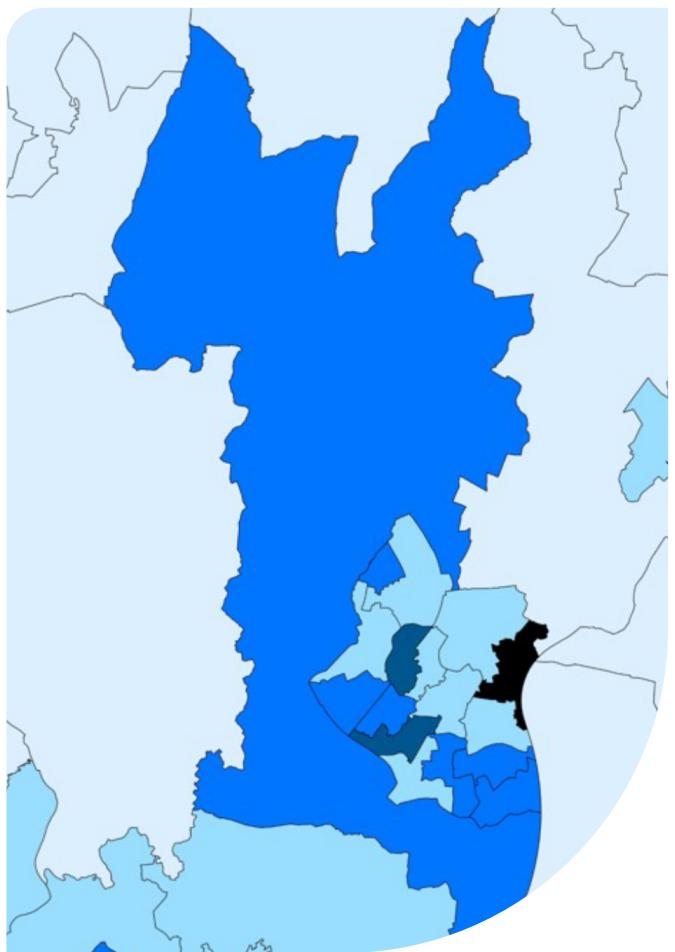

High
Medium High
Medium
Medium Low
Low

Data Summary continued

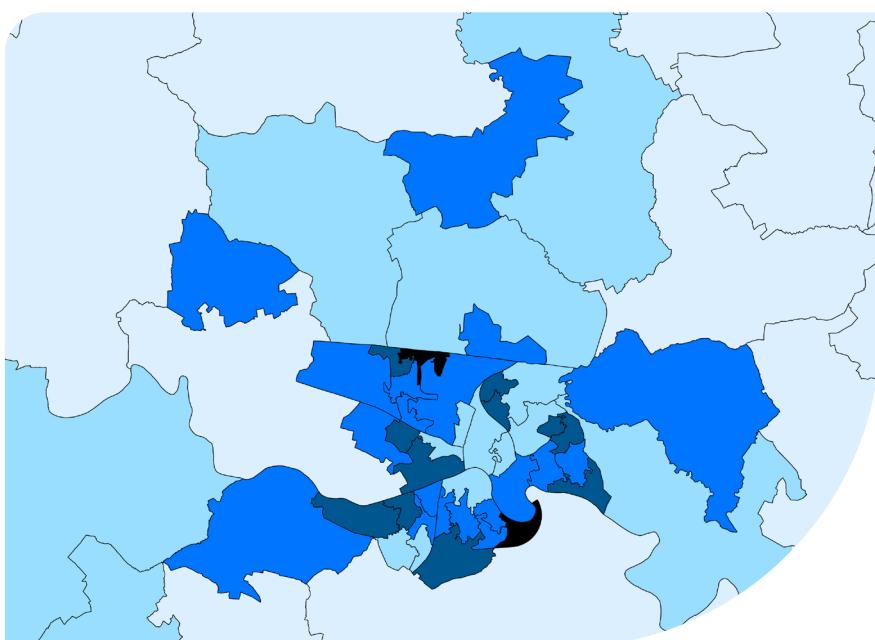

- The Worcester City Council areas of Ronkswood and Northwick:

- The Wychavon District Council's Himbleton, Ombersley, and Charity Crescent:

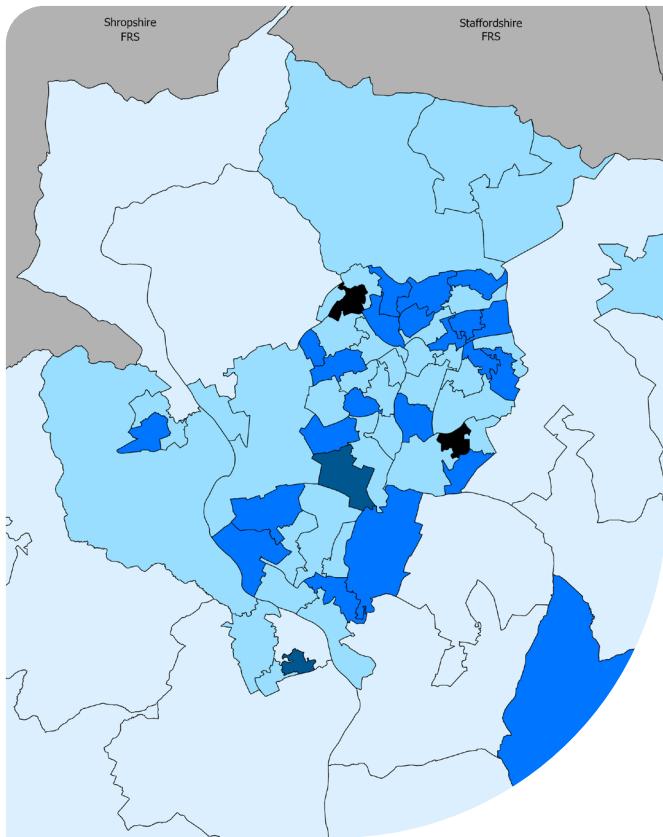

- The Herefordshire Council's Lower Bullingham and Holmer:

Risk category
High
Medium High
Medium
Medium Low
Low

Data Summary continued

- The Wyre Forest District Council's Habberley and Hoobrook:

Risk category

High
Medium High
Medium
Medium Low
Low

Similarly, areas of medium-high risk are also found within densely populated urban settings, including:

- The Redditch Borough Council's areas of Winyates, Moons Moat, Riverside, Headless Cross, Hunt End, and Woodrow,
- The Herefordshire Council's areas of Red Hill, Huntington, Tupsley, Ridgehill, Dinedor, and Holme Lacy,
- The Worcester City Council's areas of Dines Green, Rainbow Hill, and Brickfields,
- The Bromsgrove District Council's areas of Waseley Hills, Marlbrook, Lickey End, and Charford,
- The Wychavon District Council's areas of Honeybourne and Broughton Green,
- The Malvern Hills District Council's areas of Pound Bank and Upper Howsell, and
- The Wyre Forest District Council's areas of Coppice and The Walshes.

This model serves as a valuable tool for forecasting potential fire risks and, when integrated with other data sources, aids in the strategic prioritisation of preventative measures in line with national statistics.
